The Direct Service Provider Advantage:

Strategic Guide to High-Volume Manufacturing in Asia

Offshore manufacturing in Asia continues to offer substantial cost advantages for U.S. companies. **Source International** is a Direct Service Provider (DSP) with representative offices in China and Vietnam, employer-of-record status in both countries, and staff embedded in all partner factories, which specialize in high-value, precision manufacturing. We are one of the largest and a leader among companies that offer this type of service.

Learn more about the structural differences between sourcing models, how on-the-ground presence affects quality outcomes, and why engineering support separates DSPs from traditional intermediaries.

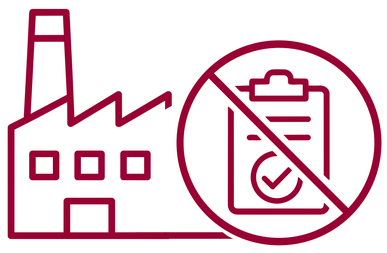
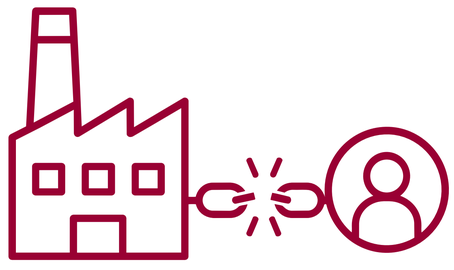
The Sourcing Paradox: Why Going Direct-to-Factory Often Fails

The direct-to-factory approach appeals to many due to lower perceived costs. However, these relationships often fail because factories tend to prioritize consistent, high-volume partners over new, unfamiliar foreign buyers.

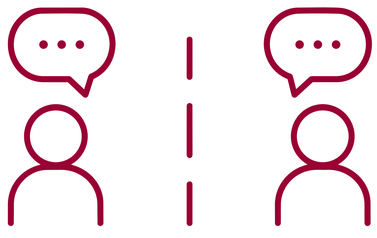
Some of the risks of direct-to-factory sourcing include:



No on-the-ground quality control. Customers cannot catch quality issues in the factories before they ship.



No accountability structure. A factory's obligation to a direct customer is minimal compared to its obligation to Direct Service Providers, who bring them consistent volume across multiple customers and have long-established relationships and reputations with them.



Communication gaps. Direct-to-factory sourcing means there is no one to help bridge time zone differences and language barriers on the customer's behalf.

In fact, some factories will refuse to work directly with a customer even when offered a commission arrangement because they still prefer working with DSPs like Source for the mutual reliability and trustworthiness built up over the years.

The Risks of the Trading Company Model

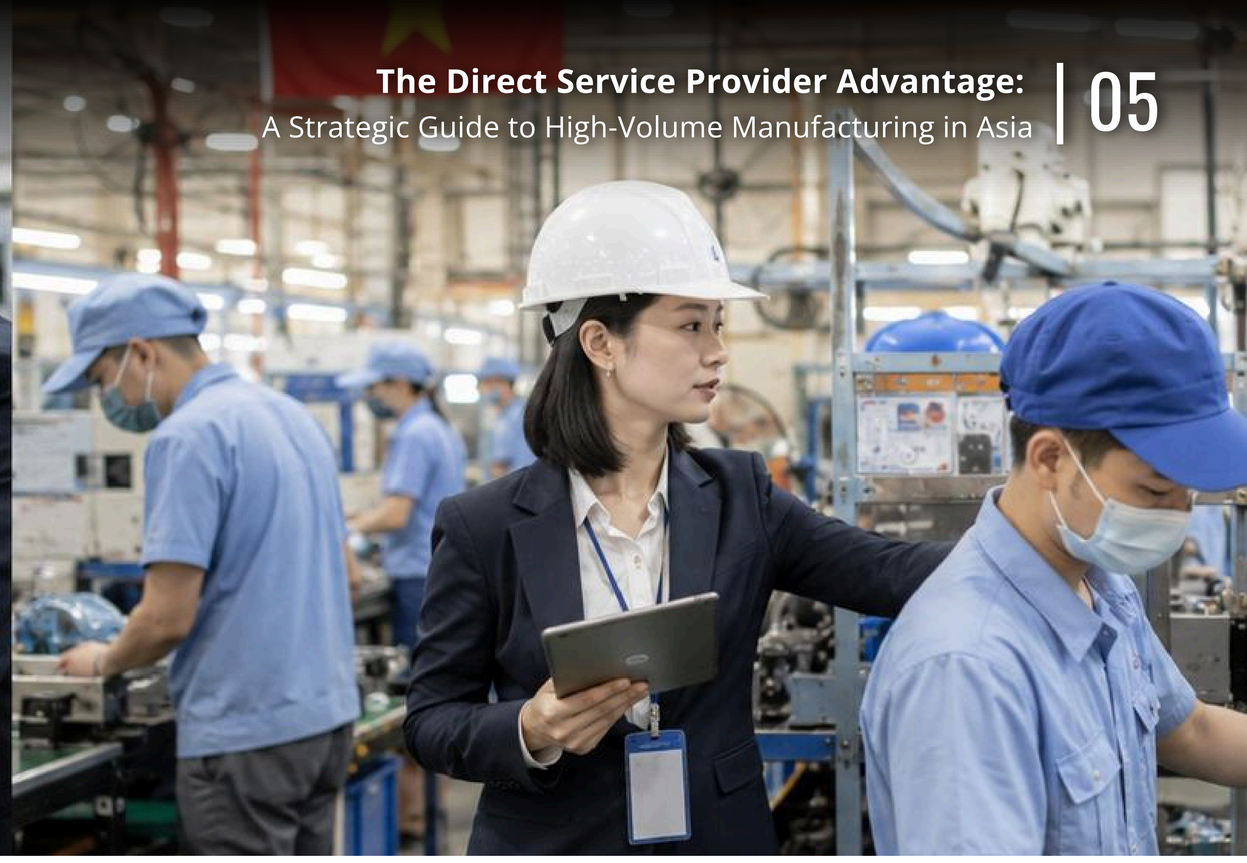
Trading companies sell goods while DSPs sell a service. This distinction fundamentally impacts quality control.

A trading company buys products and resells them, but they do not maintain offices in the countries they source from. Without employer-of-record status in these countries, they do not have employees inside the factories that can intervene if quality issues arise.

The DSP Difference: On-the-Ground Presence vs. Third-Party Agents

A Direct Service Provider maintains representative offices and legal employer-of-record status in the countries of manufacture. Our employees, not agents or contractors, work directly in factories to identify and address quality issues during production before they ever ship, assist with price negotiations, improve production process efficiency where possible, and help coordinate logistics.

DSPs leverage consistent volume across multiple product categories to maintain standing with factory management, intervening directly to manage design revisions or compressed schedules.



Our Dual-Country Footprint: Flexibility in China and Vietnam

Source International operates with full employer-of-record status in both China and Vietnam. Our staff are direct employees, not agents or third-party contractors.

Leveraging Vetted Factory Networks for Cost and Quality Optimization

Source maintains relationships with a large number of factories across China and Vietnam, developed over decades. Factory vetting happens before we add any facility to our network. We evaluate technical capabilities, quality management systems, capacity utilization, and financial stability. Our **formal factory vetting program** includes:

- Qualifying and ongoing factory audits
- KPI goals
- Benchmarking manufacturing cost drivers
- Factory score cards

Our partner factories trust us because we pay reliably and bring consistent business. For example, if you are a new customer placing a modest first order, you can benefit from the pricing leverage we carry from our existing volume with a given factory. We can advocate for better rates and priority scheduling on your behalf.

We also maintain a strict conflict-of-interest policy. Source does not take on more than one customer in the same product space.

Engineering Support: Bridging the Gap Between Concept and Mass Production

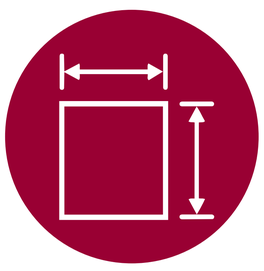
Customers come to Source at different stages. Some arrive with complete CAD drawings and production documentation. Others have a prototype or concept requiring development into a manufacturable product.

Our engineering team can help with product development and build an exclusive **Product Tech Pack (PTP)** containing:

CAD files and technical drawings

Bills of materials (BOM)

Updated sample production and manufacturing specifications



Dimensional specifications

Design-for-manufacturing (DFM) revisions

A trading company can connect you with a factory if you hand them complete specifications, but they cannot develop those specifications, troubleshoot design-for-manufacturing problems, or iterate on a concept until it becomes production-ready.

Real-Time Quality Assurance for Your Precision Products

Quality assurance begins on the factory floor, not at the receiving dock.

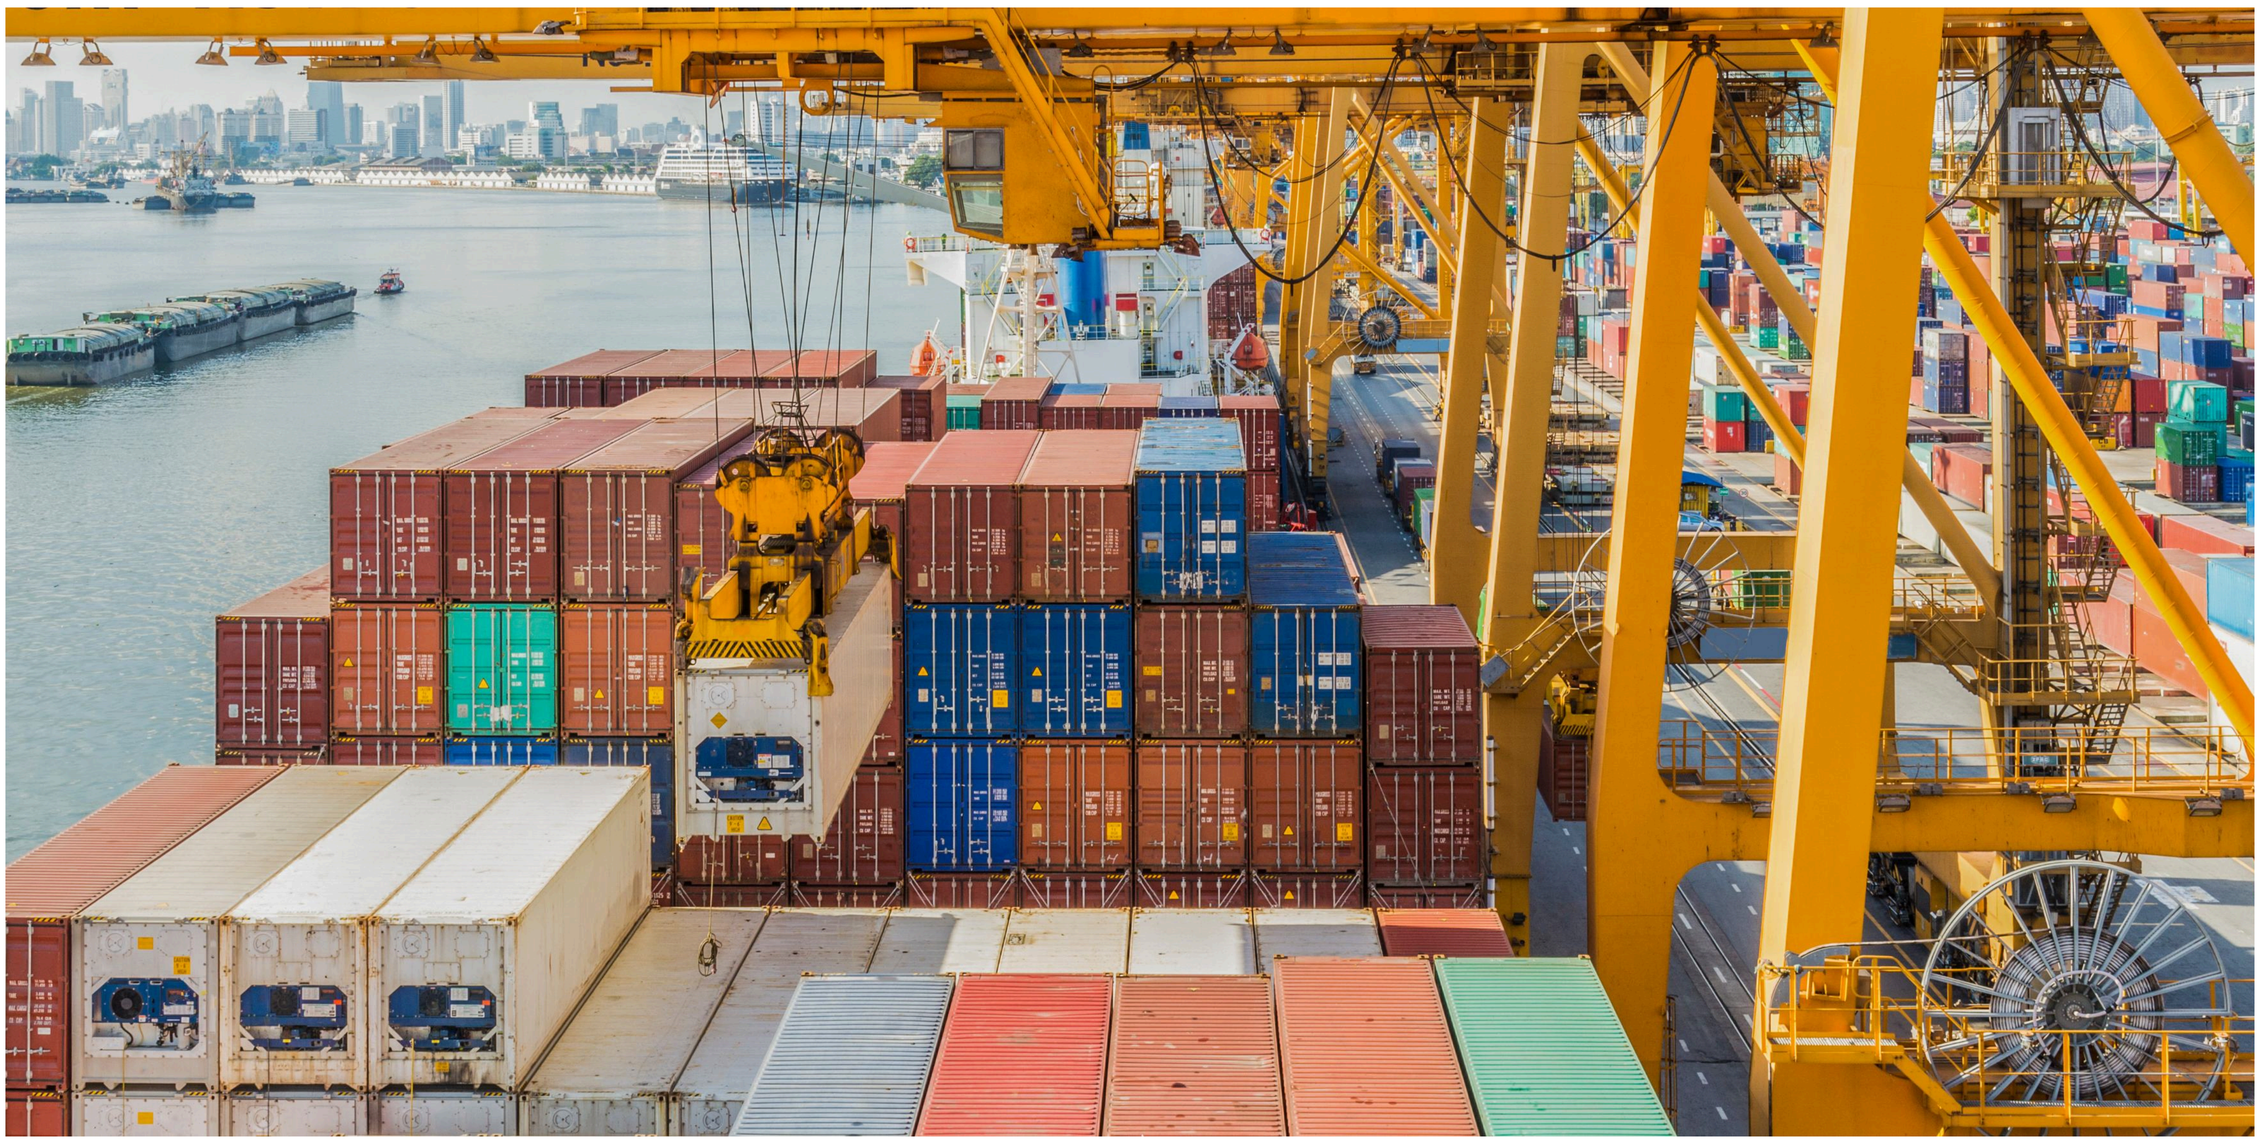
Our staff embedded in partner facilities monitors production and bridges language and time zone barriers in real time. They are present every day to represent your interests on the factory floor, not working remotely or only visiting periodically. If a production issue emerges, our people are already in the room. They can communicate with factory supervisors in the local language and make corrections while they are still possible.

We specialize in high-precision manufactured products: components, assemblies, and finished goods with tight tolerances that leave little room for variation. These products demand consistent process control and immediate intervention when production drifts out of specification. Our on-site presence enables front-end quality control, a proactive process that prevents defective products from shipping.

As a result, our defect rate of .01% is well below the industry average for offshore manufacturing.

Integrating the Supply Chain: From Factory Floor to Port of Entry

As an end-to-end Direct Service Provider, Source also helps coordinate shipping logistics, handle customs documentation, and assure timely delivery to your dock.



Strategic Freight Coordination: Moving Goods with Reliability

We manage freight logistics through established partnerships with international freight forwarders, managing documentation, tracking containers, and troubleshooting transit issues.

Digital Transparency Through Real-Time Reporting

We internally track production and shipment progress in real time and can provide report updates as needed.

Partner With Source to Build an Offshore Manufacturing Strategy

Success in offshore manufacturing for precision products requires more than identifying a factory willing to quote your project. It requires a partnership that brings engineering support, a team of product specialists with emphasis on customer service, on-the-ground quality oversight, international customs expertise, and reliable freight coordination, all working in tandem.

As a Direct Service Provider, Source International leverages our volume advantages and longstanding relationships with vetted factories to get you the best price, quality, and on time delivery for your project. We partner with you beyond manufacturing, managing logistics, transportation, customs, and tariff optimization.

If you are evaluating offshore manufacturing options, experiencing problems with existing suppliers, or looking to optimize costs while maintaining quality standards

About Us

Phoenix Metal utilizes the latest technology in 3D and solid modeling software along with CAM software for the turrets and laser machines. We work primarily with SolidWorks and AutoCad software but we can also work with most standard CAD file formats including: .dwg, .dxf, .stp, and .iges files.

Phoenix would welcome the opportunity to work with your staff to discuss your application whether it is an existing product or a new design. On existing designs, our engineering team can provide recommendations for improving manufacturability and finding ways to reduce cost. On new products we encourage early involvement of our engineering team in the design process so we can better understand your requirements. We may be able to suggest changes that could improve quality, value, and structural integrity along with improving the manufacturability of the product to reduce costs.

Our Commitment to Quality

Our business management system is certified to ISO9001:2015 by NSF-ISR. It is the focus of Phoenix Metal and the commitment of top management, to maintain a business management system, which meets or exceeds the requirements of ISO9001:2015. Strong management shall also provide the integrity and leadership necessary to carry on ethical and environmentally friendly business practices, and to remain an asset to the community. We routinely challenge our quality system with internal and external quality audits, and review this policy and business management objectives for continued relevance and effectiveness.

Phoenix Mission Statement: To help our customer, employees, and community prosper.
